

ABSTRACT

A method of retransmitting multiple error coded streams formed from
5 one block of information, if errors are detected. A first process from the
method includes forming multiple error coded streams from one block of
information. Each of the at least two error coded streams may then be
transmitted in response to a confirmation message. A second process from
the method includes performing independent error detection on at least two
10 received error coded streams. At least one confirmation message may be
transmitted in response to the independent error detection performed on at
least one of the received error coded streams.
